T+70

Estimated total 70 min. Highlighted stages are the likely contributing factors (red = primary, orange = secondary).

LIKELY BOTTLENECK CONTRIBUTIONS

Share of excess minutes identified across stages (rules + ETA-model what-if). Likely contributing factors, not proven causes.

WHY WAS THIS ORDER FLAGGED?

Model influence: change in delay probability when that input is set to a typical value (+ raises risk, - lowers it). Not proof of causation.

SUMMARY

Order ZF2048 is flagged DELAY LIKELY: the model puts the chance of a delay at 95% (high confidence) and estimates delivery in 70 min (likely 66-75) against a promised 60 min. Likely contributing factor: Transit / Traffic (30% of the excess minutes identified across stages), followed by Restaurant Preparation (19%). Factors are likely contributors, not proven causes.

Delay rule: Delayed if actual delivery time > promised ETA + 5 min. Predictions come from models trained on synthetic data and demonstrate operational ML techniques; ORDERFLOW has no access to any real platform's internal systems.
